Not illustrated. 1873 Excerpt: ... =  $t_{33} \cos r, dS$ , (12) where  $e$  is the angle between  $21$  and  $dS$ , and  $t_j$  that between  $93$  and the normal to  $dS$ , whose direction-cosines are  $I, m, n$ , and  $T_{21}, T_{33}$  denote the numerical values of  $21$  and  $93$ . Comparing this result with equation (3), it is evident that the quantity / in that equation is equal to  $93 \cos r_j$ , or the resolved part of  $93$  normal to  $dS$ . 592. We have already seen (Arts. 490, 541) that, according to Faradays theory, the phenomena of electromagnetic force and In the present investigation we propose to deduce the properties of this vector from the dynamical principles stated in the last chapter, with as few appeals to experiment as possible. In identifying this vector, which has appeared as the result of a mathematical investigation, with the magnetic induction, the properties of which we learned from experiments on magnets, we do not depart from this method, for we introduce no new fact into the theory, we only give a name to a mathematical quantity, and the propriety of so doing is to be judged by the agreement of the relations of the mathematical quantity with those of the physical quantity indicated by the name. The vector  $33$ , since it occurs in a surface-integral, belongs evidently to the category of fluxes described in Art. 13. The vector  $21$ , on the other hand, belongs to the category of forces, since it appears in a line-integral. 593. We must here recall to mind the conventions about positive and negative quantities and directions, some of which were stated in Art. 23. We adopt the right-handed system of axes, so that if a right-handed screw is placed in the direction of the axis of  $x$ , and a nut on this screw is turned in the positive direction of rotation, that is, from the direction of  $y$  to

that of z, it will move along the screw ...
