

A Unifying Field in Logics: Neutrosophic Logic, Neutrosophy, Neutrosophic Set, Neutrosophic Probability (third edition)

Starting from neutrosophy, which is an extension of dialectics, and is based on unification of the contraries and as well as neutralities in between contraries, the author generalizes the fuzzy logic (especially intuitionistic fuzzy logic), fuzzy set (especially intuitionistic fuzzy set), and classical and imprecise probabilities to respectively neutrosophic logic, neutrosophic set, and neutrosophic probability. In neutrosophic logic a proposition P is characterized by three standard or non-standard subsets of $]0-, 1+[$ representing the truth value, T , the indeterminate value, I , and the false value F . There is no connection between T , I , F in general, which permits the characterization of intuitionistic logic (when the sum of components is less than 1), paraconsistent logic (when the sum of components is greater than 1), or fuzzy logic (when the sum of components is equal to 1). Similarly are defined the neutrosophic set and neutrosophic probability.
